

... cont'd from last time :  
finishing up reading studies

- two other findings :

1. - counter of gravity effect

2. reading strategies  
eg. careful vs. risky  
- not known whether  
you can choose this

trajectory :

thought to be computed  
in brain

microsaccade to  
correct

neuroscience

functional regions  
- Broca's area  
→ language

## Scene Perception

- main difference vs. reading:  
no known strategy
- context is important  
(e.g. expectations - what do you expect to see)
- Scenarists are task-dependent <sup>in</sup> a scene — Yarkov

- 3 reasons to study eye movements:
  - eye movements are critical for efficient & timely acquisition info
  - how we acquire info is important in study of perception & cognition

best of  
both:  
Retrospective  
Think-Aloud

subversive measure doesn't interfere

↳ becoming particularly important for  
usability studies

↳ e.g. argument analogous to  
one against Think-Aloud  
↑  
subversive

doesn't interfere  
with  
task

- Two important issues:

1. where fixations go — Regions of Interest  
ROIs

2. how long do they dwell there

fixation duration  $\stackrel{?}{\equiv}$  cognitive load

- Methods

- fixation location
- fixation duration
- total time ROI fixated
- first fixation duration (within ROI)
- first pass gaze duration (time in region)
- second " " " (2<sup>nd</sup> time in ROI)

very common

↓  
scannable  
(order)

(CSPC)  
Scene periphery  
- also relevant  
to visual  
inspection  
(IS)

Tasks:

## Reception of Art :

- locations tend to be regular (falling on same regions)  
why? maybe because artist wanted you to look there ...

- Dare Woodings : 5,000+ subjects (London gallery)

## Visual Search

∴ how we search for things in image

- active research area, particularly for modelling

# Visual Search Models?

Treisman's FIT

Feature Integration Theory

Wolfe's Guided Search

Ostergaard and Macken's \_\_\_\_\_

ITTE et al: a very good computer model of visual search (still  $\neq$  now video)

contrast, luminance, etc.

saliency-based

↳ known to attract visual attention — modeled on neurons in the cortex

## Natural Tasks

- Land + Hayhoe → sandwich making  
making tea
- eyes provide  
info (as needed) — you don't  
memorize everything  
about the scene
- eyes usually  
provide motor  
functions (hand movements)

### Other tasks

- Auditory language processing — psycholinguistics
- math, number reading
- Face perception — see Regier's article
- Illusion

Last time:  
eye movement research in psychology

Policy:  
IE (HF) + CBC

IE: looking at environments where humans work

Megan + Richardson (1973?)

of survey of eye movement metrics

aviation  
driving

visual inspection:

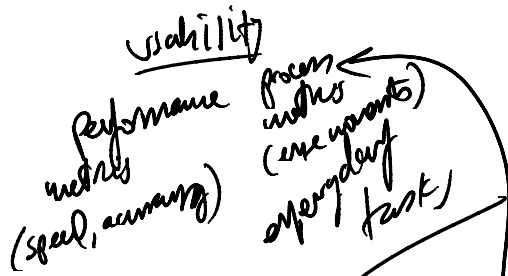

- conveyor belt lines (looking at bottles, underwear,

- X-rays } radiologists garments)

training

TSA  
people

at airport

In HF:

- simulators are often used / developed

e.g. cockpit / flight simulators

driving simulators

cars

trucks

trawlers

vision in

vehicles

conference

aviation  
conferences

Anders (2001)

chip

Escalfer

e U of Calgary

cluttered scenes

"vigilance studies"

do operators fall asleep

(eye lid tracking)

driving: cell phones are ~ hot topic  
these days

Crosier & Andre (1999) :

Electronic Moving Maps (EMMs) :

for aviation : did they help pilots taxi better  
(ex in bad weather)

new display design

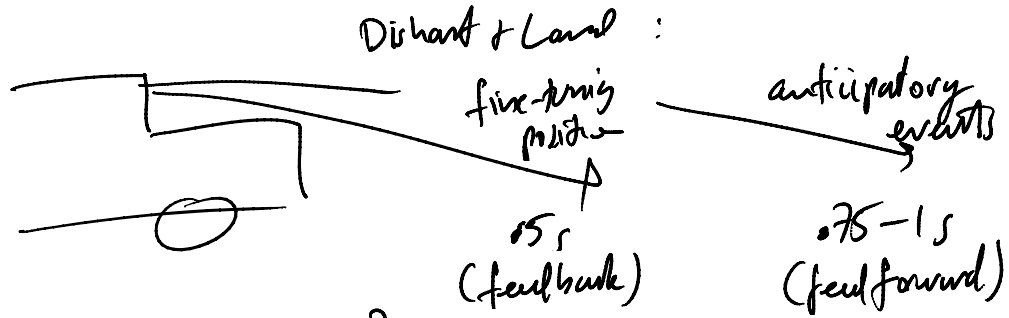

where do  
start look?

Chapman & Underwood : driving experiments →

expert to novice comparison

↑  
hot topic in eye tracking right now

popular technique is to use genetic algorithms for  
bioinformatics : comparing scan-paths : like DNA  
sequence

where do drivers look?

straight roads: roughly at point near to focus of expansion (where objects appear stationary)

curve: at tangents

More visual inspection:

Schoonard et. al :

inspection of: poultry, meat, fish

drug labels (usability of drug labels) (Bajto 2006) — (drugs, x-rays, production line photo interpretation) —> aerial photo inspection

— Usercenter in Chicago with Abby Steptage  
; Jen Pappas } CU  
Psych student

Megan + Richardson:

metrics:

- fixation duration
- # fixations
- spatial distribution (coverage)
- interfixation distance
- direction of eye movements
- sequential indices (scanpaths)

# HCI : CPSC

1990 { Robs Jacobs @ Tufts  
- WYSIWYC  
- Midas Touch problem

Sturker & Bolt  
eye-tracking + other stuff

voice  
knaps  
brain  
multimodal  
VR

weighty  
you look at  
gets activated

"usable app"  
interactive app  
~ feasibility study

no easy way to click on something with eye => dwell time (500 ms)

Starkov & Bolt: interactive 3D world ("Little Prince")

- storytelling - narrative would change

based on gaze

→ may be relevant to  
game play

- dwell time: seek to  
zoom in

↓  
how to use gaze  
for interaction

(navigate in 3D)

→ David Smith's ACE 2006 paper

- Majumdar et al (from Finland - Univ. of Tampere)

↓  
ETRA 2000 or 2002  
survey of eye tracking

→ pretty difficult to pull off for conference

→ broad + better app for eye tracking manufacturers  
(disability app) — "Universal Accessibility"

↓  
was an NSF funding program

Shimin Zhai - IBM  
- MAGIC pointing

↳ Manual Accidental Gaze Input Cascaded (?)  
↳ a way to ward the mouse pointer

- goal point  
made a papers  
eye is a perceptual organ  
not meant at things

↓  
motivation for  
↑

accuracy mouse pointer -  
not stand to the eye

Fitts Law:  $MT = a + b \log_2 \left( \frac{A}{w} \right)$

(mean selection time)

$a$ : amplitude (dist)  
 $w$ : width

Zhai et al's paper: technical development + empirical analysis

↓  
motivated by Fitts' Law  
which is a model of hand movements

Q: Do eye movements: do they follow Fitts' Law?

(Yes) — see Ashore's 6D 05 for refs —

Špakar & others

Other Models (modeling paper)

	ACT-R	EPIC
successive dist:	variable	constant
target overlap:	never	regularly
mouse:	follows random	starts after sacade ends
scanner/monitor menu:	only top-down	top-down + random

} models of cognitive processes  
"low-level keystroke models"  
↓  
see also KLM  
} this was in contrast of pull-down menus

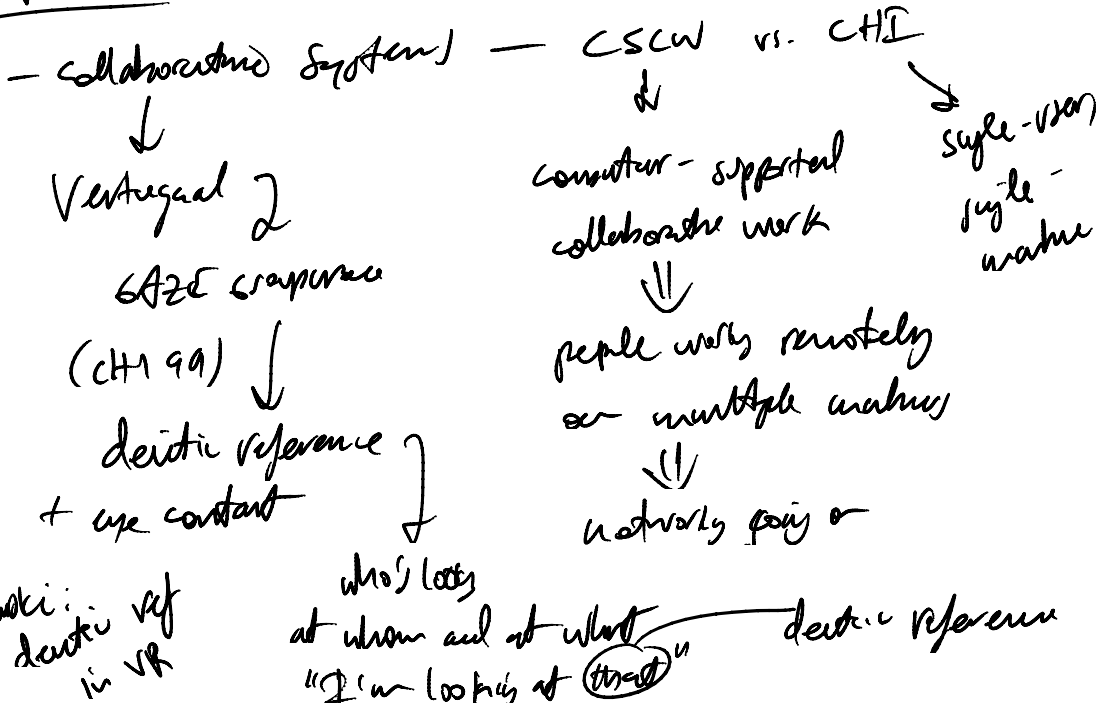

Result: "general truth": neither model correct (for this task)  
— Hornof (J of Ergon)

## Usability:

- lots of stuff going on here
- Evans et al 2006 - Stimulated retrospective  
validation paper ← Think-Aloud  
↳ usability  
repleting  
scenarios, get subjects to construct
- Bojko has a bunch of papers
- Nielsen Norman Group doing large scale studies
- business off, seems like

# Interactions:

GCDs:

McConkie & Regner  
Loddy & McConkie  
Leister  
Luhke  
Wutson  
Dschonki

LOD: level of  
Detail  
at Jones

Jones vs Perryberg
